

— UX & Navigation

.

Summary & Scope

Pwede nimo i set ang priority depende sa imong time and prime concern

Category	Priority	Key Target Areas
Navigation Architecture	High ▾	Dynamic back links, structural breadcrumbs, modal lifecycle management
Interface Interactivity	High ▾	Client-side filter states, hover feedback, dynamic empty states
Mobile Accessibility	Medium ▾	Horizontal swipe pill containers, floating action targets

1. Back Navigation & Secondary Navigation Options

Para ma ensure that users maintain spatial orientation while exploring deep content hierarchies, ako idea is to apply these following global navigation controls to be integrated into the page flow.

Dynamic Contextual Back Link

- **Behavior:** Mag render og explicit contextual back link anchored directly above primary article headers and detail overlays. Though, you have the decision on where to put the button.
 - Example: (← Back to [Category/Previous View])
- And I hope to remove the scrolling feature sa background when opening an article.

- **Fallback:** If direct entry (like for example kanang - URL sharing) occurs without a session history, fallback to ← Back to News Overview or sa Home page

Structural Breadcrumb Trail

- **Placement:** Depends to you
- **Hierarchy Structure:** Home > News & Updates > [Category] > [Article Title]
- **UX Specification:** Non-active nodes must remain fully clickable anchor elements so ang current page/article node remains static text styled in a muted font tone. For enhancing ux design ang purpose ani.

Filter State Reset Controls (optional lang hehe)

- **Primary Trigger:** Clicking the *All Stories* filter tab clears all active search like ang queries, tags, and pagination bounds.
- **Secondary Trigger:** If you want, display an explicit "Clear Filters" inline button whenever custom tag combinations yield zero or refined results.

Modal & Overlay Dismissal Architecture

- **Visual Anchor:** Embed a prominent Close (X) CTA in the top-right corner, paired with a ← Back to Feed button at the bottom of modal windows. But I feel like enough na to ang Back to Home na button.
- **Input Triggers:**
 - Keyboard: Register Esc key up events globally to dismiss active modals. For convenience hehe
 - Pointer: If mag click ka anywhere on the semi-transparent backdrop overlay immediately terminates the modal state.

Pagination & Carousel Interactions

- **Controls:** Provide dual-ended arrow controls (Previous / Next) paired with a centered row of bullet pagination dots. This would be applicable if gusto ka mag add og more pages/articles.

- **State Feedback:** Disable left/right arrows when reaching bounds (first/last page) using accessible visual opacity styling.

2. Web Page Improvements

Floating Back-to-Top Action

- **Placement:** Fixed to the bottom-right .
- **Scroll Threshold:** Remained completely hidden until the user scrolls to the bottom.
- **Transition:** Fades in smooth over and triggers a `window.scrollTo({ top: 0, behavior: 'smooth' })` execution upon touch or click.

Search Bar for Fast Content Lookup

- **The Problem:** As you publish more stories, if mangita ang user og specific article (example "WSB 2026" or "Danztrack") requires scrolling through the entire grid.
- **The Fix:** Add a minimalist search input field kilid sa category filter pills that filters news card titles in real-time as the user types. Results would be based sa matching words na gi type. **(ACTUALLY WILL IMPLEMENT THIS nkalimot kog add ky dghan na kayg articles)(DIBAAAAA) (MURAG MADUNGAGAN PA JUD NA IN THE FUTURE)**

Empty State Fallbacks

- **Condition:** Triggered when a filtered tag produces zero matching content items.
- **Layout:** Render a centered empty-state UI containing a contextual illustration/icon, a clear title (example "*No stories found in Auditions*"), and a clear secondary CTA button.

3. Mobile Responsive Pill Navigation

I noticed sa small phone screens, all 6 category buttons (*All Stories, Championships, Auditions*, etc.) won't fit side-by-side without getting squished or breaking the design.

Smooth Swipe Container

- **What it means:** Put all the category pills in a single horizontal row para ang mga phone users can easily swipe left and right with their thumb.
- **How it behaves (scroll-snap):** When the user swipes and lets go, the buttons snap cleanly into place instead of stopping awkwardly mid-button. This is to enhance lang ang ux/ui design

Faded Edge Indicators (Visual Cue)

- **What it means:** Add a soft, transparent fade (gradient overlay) on the left and right edges of the button bar.
- **Why it matters:** It subtly cuts off the edge of hidden buttons, para naay signal ang users: *"more categories this way—swipe to see them!"* (pero ayaw explicitly add nang phrase, like for indication lang)
